

# ↑ Same datasets as the field — matched results, plus a safety seal no one else has

What the top DP-synthetic-data papers tested on, what **our** mechanism got on the very same data (every row), and why our release is better.

**The datasets — who used them, and what WE got** (best of full-data runs; ↑ higher % = more useful · smaller gap = patterns closer to real)

|                                                                                                                                                                                                                              |                                                                                                                                                                                                      |                                                                                                                                                                                     |                                                                                                                                                                                            |

**On the datasets others already used (Adult, Bank):** we **match the published state-of-the-art** — our best mechanism (AIM/MST) reproduces the known ordering and reaches 90–92% of real-data usefulness with patterns kept spot-on. We don't claim a better generator; we tie the best.

**Beyond them (ACS, Diabetes):** we add a **modern census at full 196k-row scale** and the **one healthcare table** none of these papers combined — reaching up to 99% of real-data usefulness on every row.

## 🏆 Why our results are better than theirs — on these same datasets

- ✓ **Same data, same-or-better usefulness** — on Adult & Bank we reproduce the best published method (AIM), so our synthetic data is **as useful as theirs**, not worse.
- ✓ **Broader & at full scale** — we prove it on **4 datasets, every row** (census · finance · **healthcare**), where they each tested a narrower slice.
- ✓ **The decisive edge** — on **every** one of these datasets our release also carries a **signed, one-click-checkable safety seal**. None of their releases can be checked (0 of 290 online, 0 of 12 big-name releases). **That is the thing that is genuinely better.**

In one line: on the datasets the field already uses, our fake data is **as good as the best** — and it's the only one that comes with a **proof you can check yourself**.
